Genetics of asthma: from associations to interventions

Manuel Ferreira, PhD

QIMR Berghofer Medical Research Institute
Royal Brisbane Hospital
Herston, Australia

To date, genome-wide association studies have identified ~40 genetic risk variants for asthma and related allergic conditions. An important challenge we face is how to identify the genes that underlie these associations and, amongst these, how to determine if disruption of gene expression might provide a promising therapeutic approach for asthma. In this talk, I will outline how we address these challenges by integrating results from genetic, functional and clinical studies.

Host: Luísa Romão
BioISI GER

When: 8 June 2016, 12h00

Where: Building C3, room 3.12.15

Faculdade de Ciências da Universidade de Lisboa
Campo Grande, Lisboa (Portugal)
