SEMINÁRIO DE LÓGICA MATEMÁTICA

Dia 31 de Março (quinta-feira), às 15H00, na sala 6.2.33

A result relating the monotone functional interpretation and the bounded functional interpretation (part 4 and last)

Pedro Pinto

(Faculdade de Ciências, Universidade de Lisboa)

Abstract:

Bounded functional interpretation was introduced by F. Ferreira and P. Oliva in [1] as an interpretation of Heyting arithmetic that greatly differs from Gödel's Dialectica interpretation. By a composition with a negative translation is possible to obtain a bounded interpretation of Peano arithmetic. In this talk we start by presenting a direct bounded functional interpretation of Peano arithmetic, [2]. Next we show a result by Kohlenbach relating his monotone interpretation and the bounded interpretation, [3]. More precisely, we show that over the model of the strongly majorizable functionals a solution for the bounded interpretation is also a solution for the monotone interpretation, although the latter uses the existence of an underlying precise witness.
