Commentaries on the application of the  
bounded functional interpretation

Pedro Pinto  
(Technische Universität Darmstadt)

**Abstract:**

The classical bounded functional interpretation [1] was recently shown to be a valid technique to employ in the proof mining practice [2][3]. In this talk, I will discuss some subtle features of recent "minings" guided by this functional interpretation. I will talk about the quantitative version of the metric projection argument. Next, we will look at the quantitative treatment of a nontrivial discussion by cases and how it guided the recent analysis in [4]. We finish with some brief considerations about metastability results.
